CROPTO

Tokenized Local-Market Risk Infrastructure for Commodity Trade

- A hedging and trading layer built on tokenized spot indices of local physical markets
- A bridge between real-sector commodity participants and blockchain-native liquidity
- Start with market-native hedging needs, then scale across corridors and commodities

Fully operational spot & options markets
Arbitrage mechanisms in place
NFT contracts confirmed on blockchain.

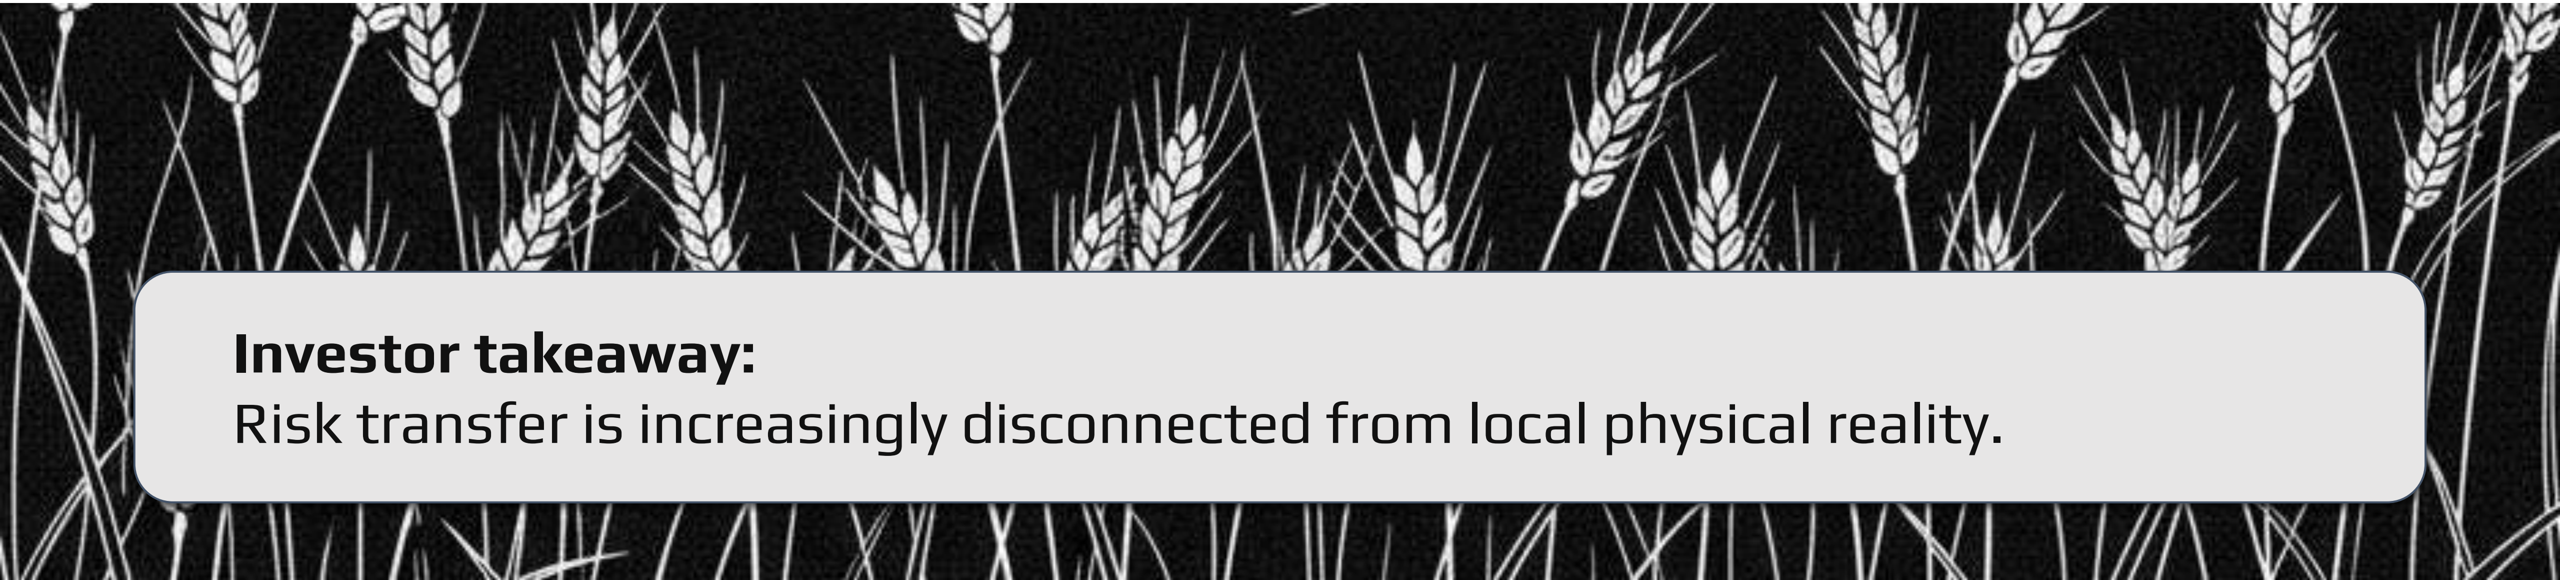
The Problem

Markets are volatile — but local fundamentals are not always the driver.

- Global commodity markets operate in sustained turbulence driven by geopolitical and macro shocks
- Financial venues concentrate large liquidity pools increasingly influenced by technical and emotional flows
- A large share of price volatility does not reflect real, local physical supply/demand fundamentals
- Real-sector participants absorb risk that is hard to hedge efficiently and affordably



Investor takeaway:
Risk transfer is increasingly disconnected from local physical reality.

Why Existing Hedging Is Not Enough

Available hedges are not always effective hedges.

- Participants are forced to use major exchanges (e.g., CME, MATIF) or avoid hedging entirely
- Small and mid-sized players often lack practical, accessible alternatives
- The core structural issue is basis risk: benchmarks do not track local physical market behavior closely
- High basis risk reduces hedge effectiveness and lowers the economic value of risk management

Why hedges fail in practice

Cropto Thesis

A market-native hedge built on tokenized local spot indices.

- Cropto creates an accessible hedging alternative with higher correlation to local physical markets
- Instruments are designed on tokenized spot indices of local markets
- Real-sector participants get tools aligned with their actual trading environment
- Settlement and market access use efficient and scalable blockchain rails

Local market reality

Spot indices • high correlation • physical context

Programmable market access

On-chain settlement • scalable liquidity • transparent rails

What We Are Building

A global platform for hedging and trading tokenized commodity indices.

Tokenized local spot indices
Reference layer anchored to local physical markets

Hedging instruments
Market-native tools for real supply and demand participants

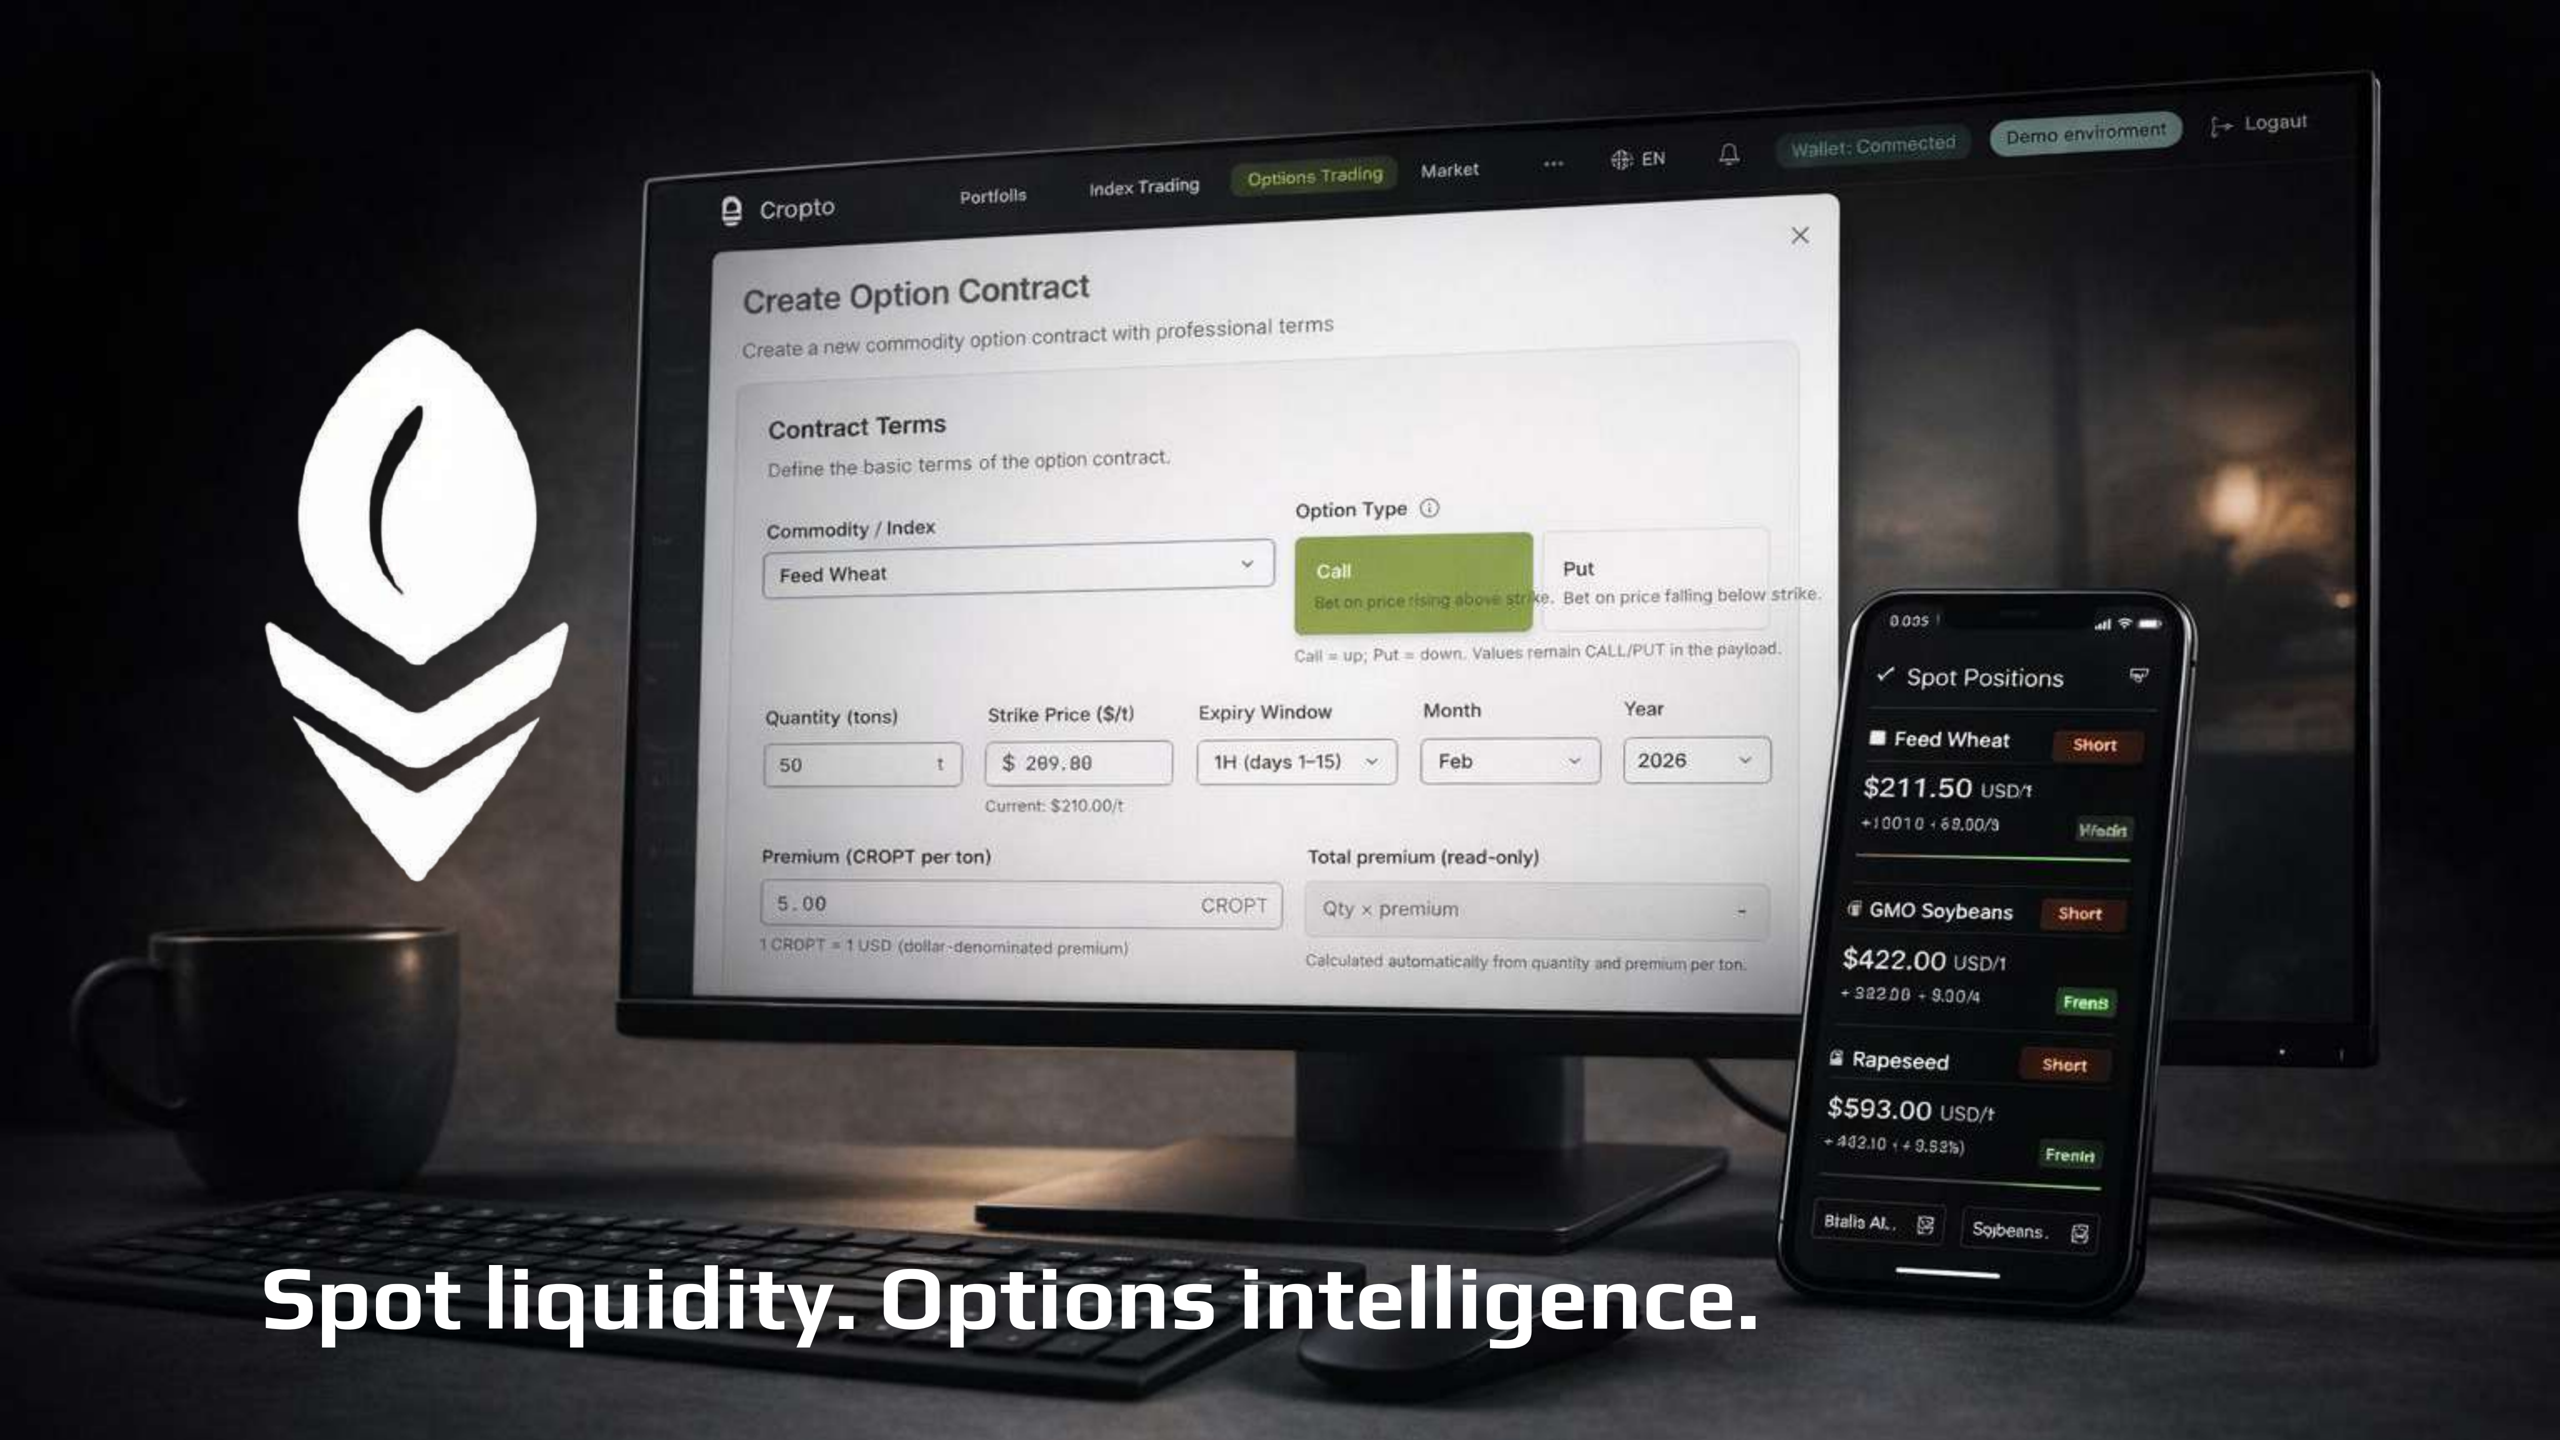
Trading venue
Speculation and arbitrage to deepen market liquidity

Cross-market strategies
Across regions, commodities, and delivery months

Transparent execution rails
Programmable settlement and auditability

Access and market design
Rules aimed at fair access and scalable market structure

Positioning: not replacing physical trade — building the risk layer it lacks.



Spot liquidity. Options intelligence.

The Cropto Liquidity Flywheel

How utility and liquidity compound over time.

Message: Cropto turns fragmented local risk into scalable, tradable liquidity.

Market Transformation Vision

From physical noise to a cleaner risk market.

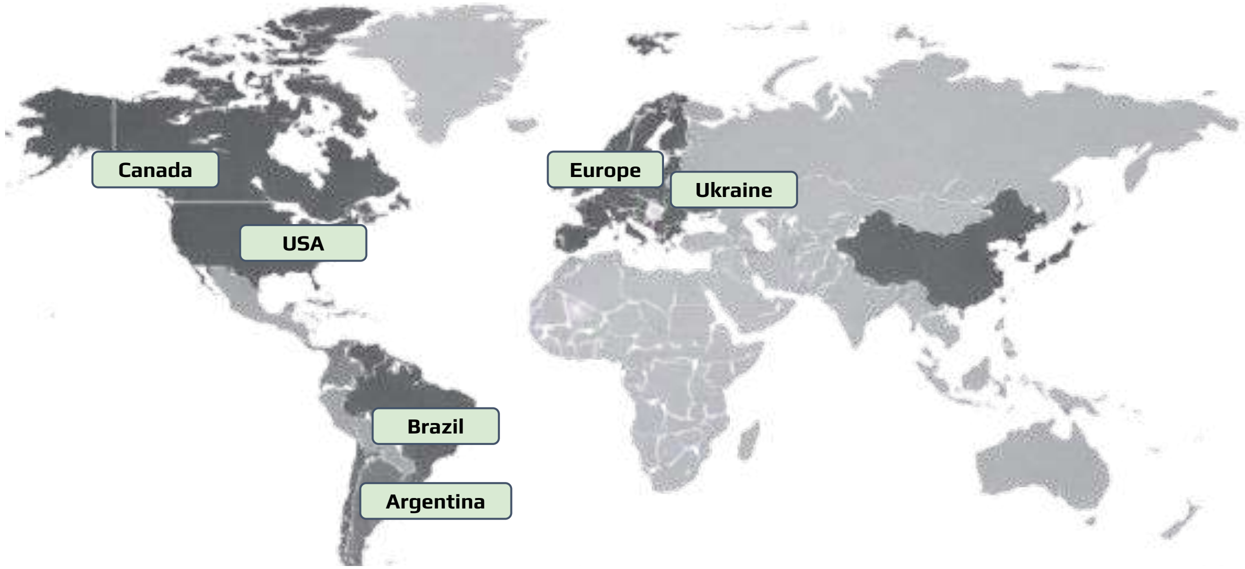
- Smaller traders can access local-market risk without participating in physical logistics
- Speculative capital absorbs risk inside Cropto markets instead of fragmenting the physical chain
- The real supply chain becomes more efficient and less noisy
- Trading firms can build new models on localized risk infrastructure
- More liquidity improves hedging quality — reinforcing adoption through a flywheel effect

Cropto becomes the home for localized commodity risk transfer.

Markets & Expansion Logic

Start local. Prove correlation. Replicate globally.

Focus markets



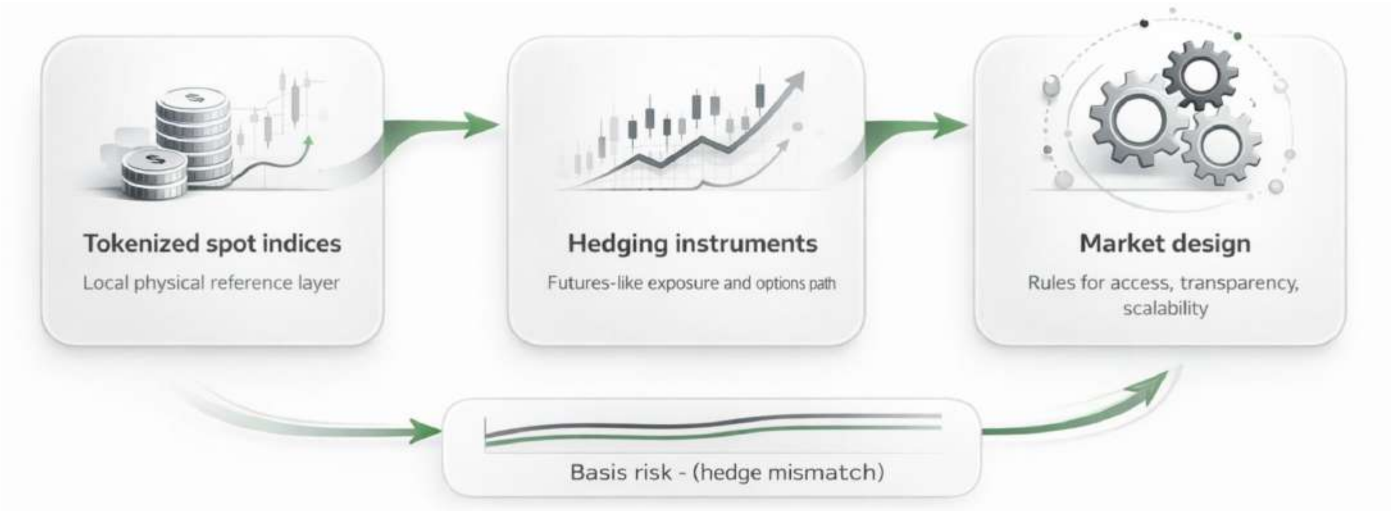
Expansion principle

- Start where hedging pain and basis-risk mismatch are strongest
- Build index integrity and local relevance first
- Replicate market design across regions and commodities
- Scale as liquidity and index coverage mature

Long-term direction: add corridors and products as liquidity and index infrastructure mature.

Index → Instruments → Market design.

- Cropto is designed for real users first, with room for professional trading strategies
- Instruments are anchored to local markets to improve hedge correlation and usefulness
- A transparent market structure aims to make risk transfer accessible and scalable



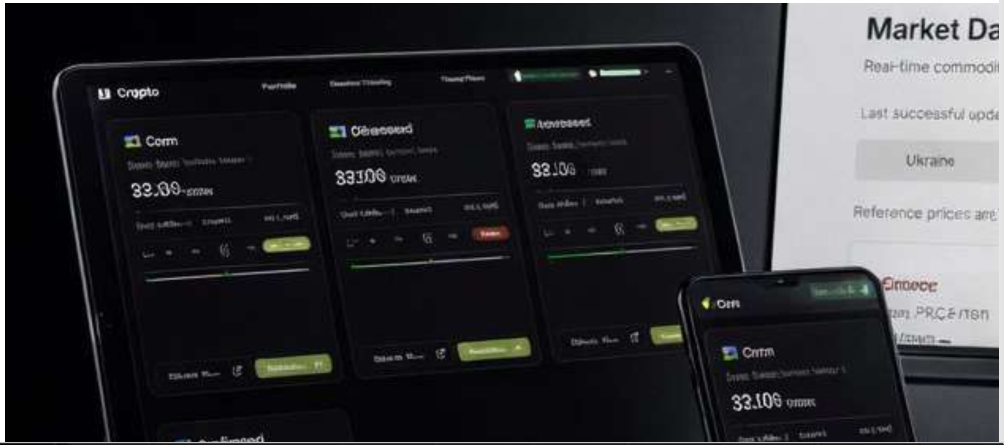
This is not a “crypto derivatives app”. It is a local-market risk infrastructure layer.

Why Now

Timing: tokenization is advancing — but hedging still lacks local-market tools.

- Tokenization of real-world assets and market infrastructure is moving from concept to implementation
- Commodity markets still lack accessible, local-market-native risk tools
- Blockchain rails make smaller, more flexible market structures economically viable
- Cropto sits at the intersection of real hedging demand and programmable market infrastructure

Status & Partnership



Current status

- Product is in active development with substantial functionality implemented
- Platform can be explored and tested in its current state (ongoing refinement)
- Index coverage and market readiness are the near-term focus

Execution focus

Next milestones

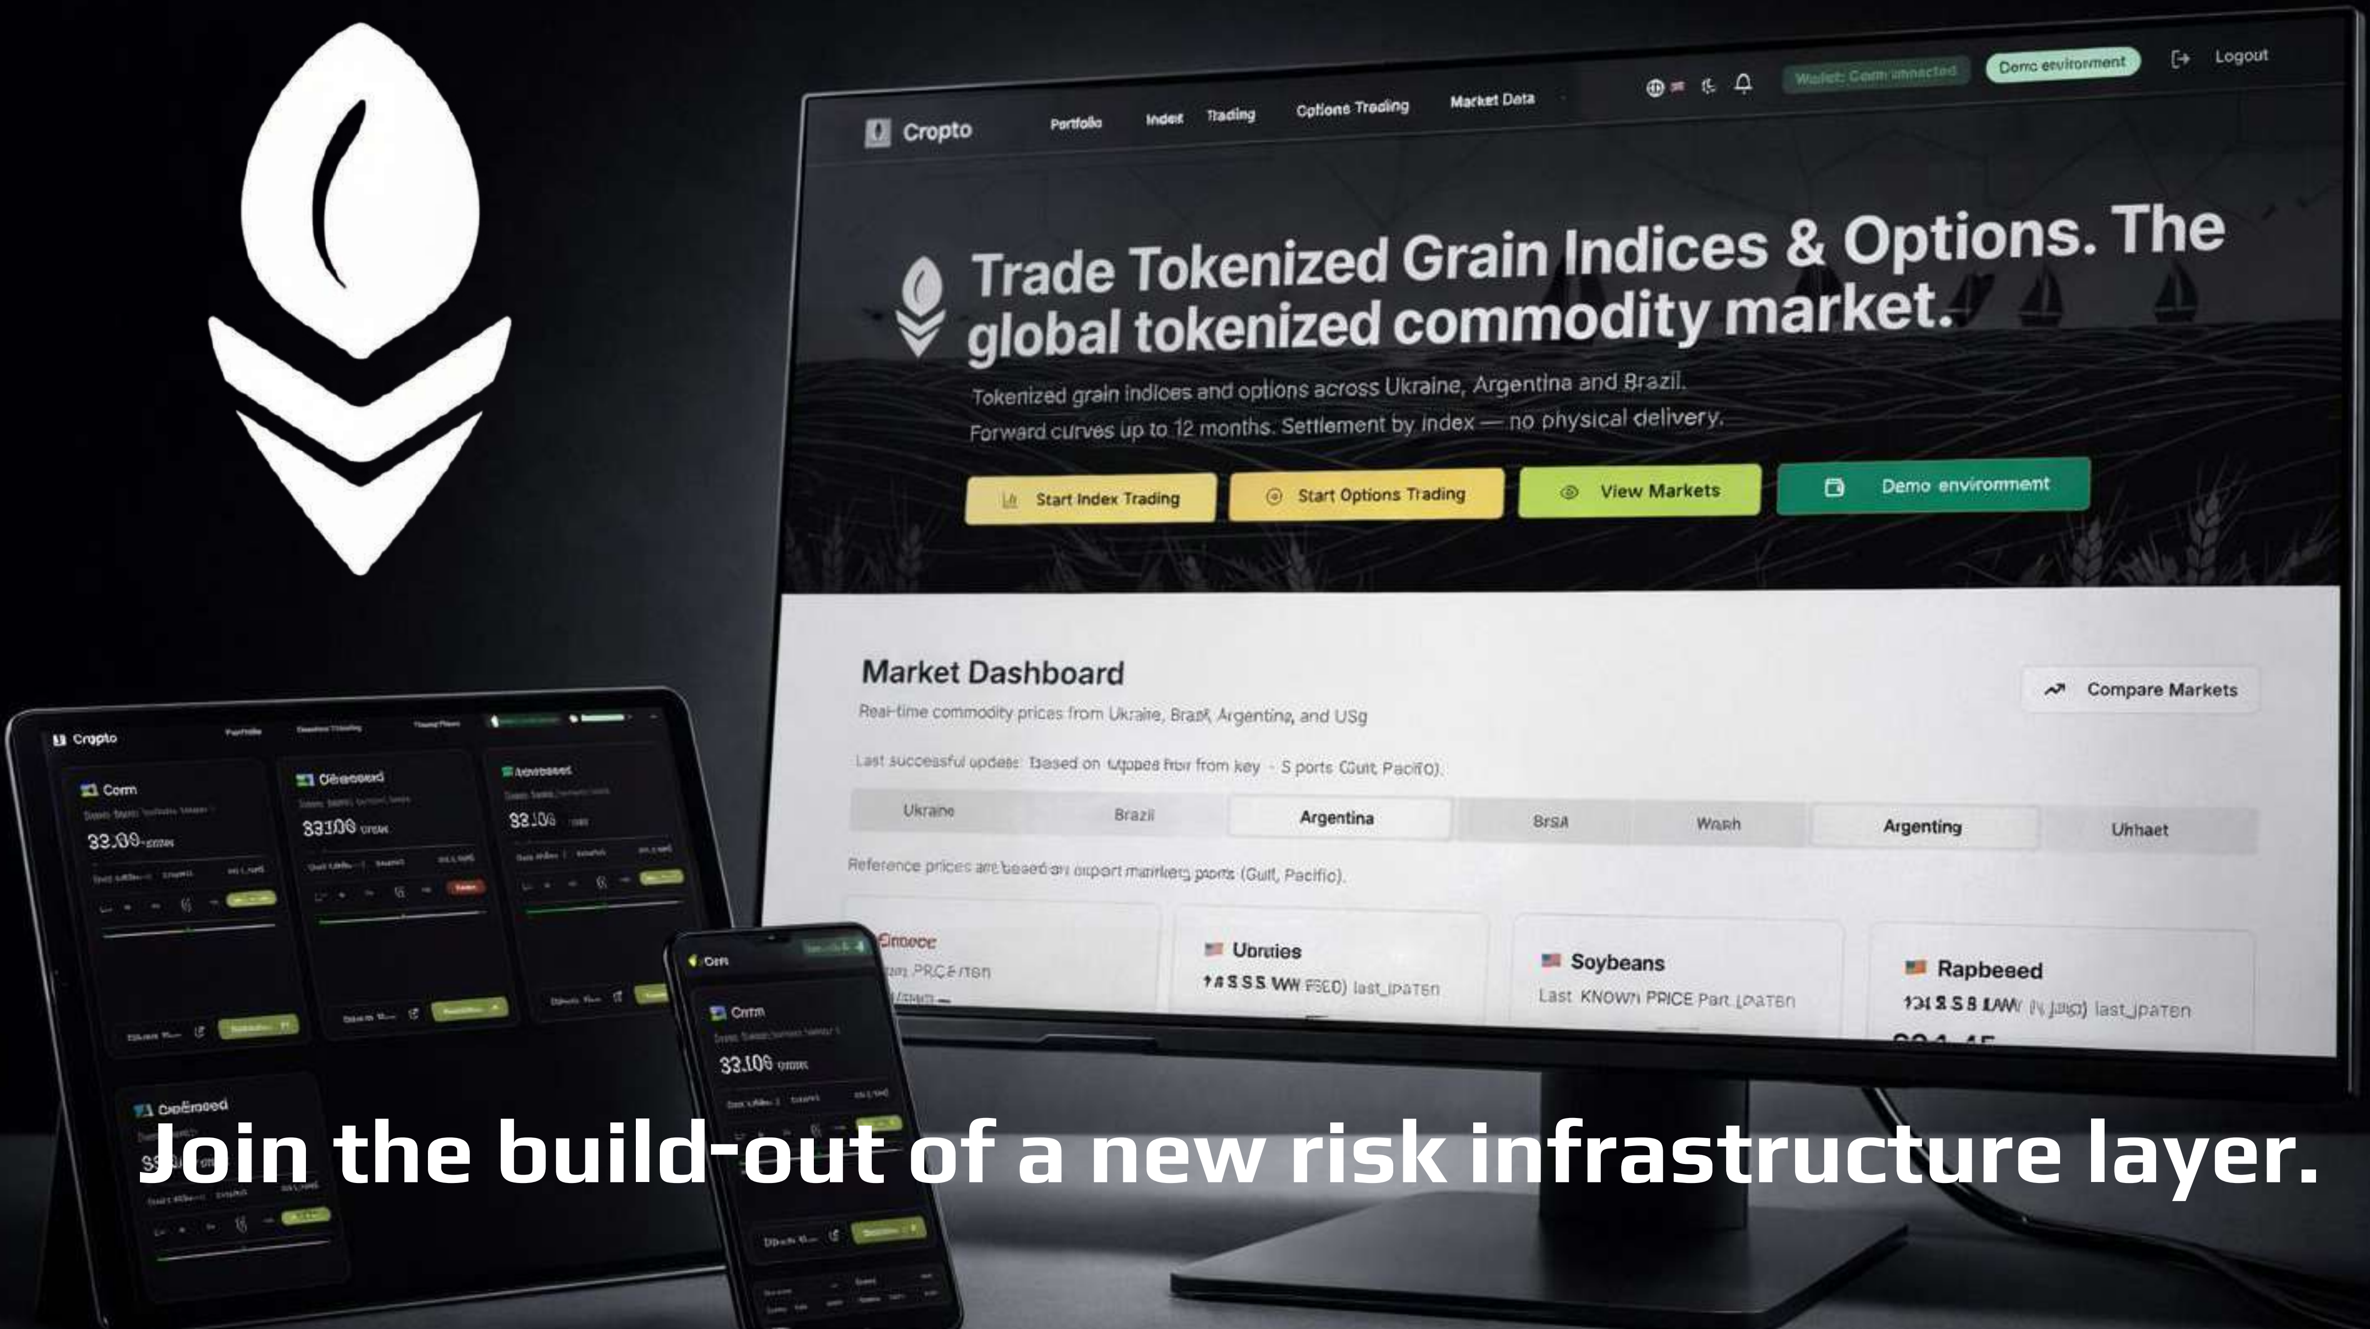
- Strengthen local index data pipelines and integrity
- Expand testing with real participants and partners
- Launch focused corridors and liquidity strategy

Build — Validate — Launch — Scale

Partnership / investor invitation

Cropto is designed to become the risk layer for physical commodity markets — market-native hedging tools powered by scalable infrastructure.

- Partner on market design, liquidity strategy, and corridor launches
- Support index infrastructure build-out and validation with real users
- Help scale the model across regions, commodities, and delivery months



Join the build-out of a new risk infrastructure layer.
